

10610COM 524500 Convex Optimization for Communications and Signal Processing
(通訊及信號處理之凸優化方) (Fall Semester 2017)

Lecture hours: **W3, W4, F3, F4** Classroom: **Delta 210**, 台達館

Instructor: 祁忠勇 (Chong-Yung Chi), Office: Room 966, 台達館

Office hours: **13:30 pm-15:30 pm (Tuesday & Thursday)**

<http://www.ee.nthu.edu.tw/cychi/>

Tel: 03-5731156 or ext. 31156, E-mail: cychi@ee.nthu.edu.tw

Convex Optimization has been recognized as a powerful tool for solving many science and engineering problems. Over the last two decades, convex optimization has been successfully and extensively applied to various problems in signal processing such as blind source separation (BSS) for biomedical and hyperspectral image analysis, and in multiple-input multiple-output (MIMO) wireless communications and networking, such as coherent/noncoherent detection, transmit/robust/distributed beamforming, and physical-layer secret communications. Particularly, fourth generation (4G) wireless communication systems have been in operation, and various researches for fifth generation (5G) systems, e.g., massive MIMO, millimeter wave wireless communications, full-duplex MIMO, energy harvesting, and multicell coordinated beamforming, have been intensively studied and reported in the open literature, where the convex optimization tool is extensively wielded, validating its central role to the development of 5G systems and to many interdisciplinary science and engineering applications. This course is to introduce convex optimization concepts and methods, available software and their applications.

Background: A good background in linear algebra and matrix theory is desirable.

Course Outline:

1. Background materials in linear algebra and matrix theory
2. Convex sets
3. Convex functions
4. Convex optimization problems
5. Duality
6. Interior-point methods
7. Applications to communications/signal processing and other engineering problems

Textbook:

Chong-Yung Chi, Wei-Chiang Li, and Chia-Hsiang Lin, Convex Optimization for Signal Processing and Communications: From Fundamentals to Applications, CRC Press, Taylor & Francis Group, Feb. 2017. (432 pages).

The material of the textbook, systematically introduces how to efficiently and effectively solve an optimization problem, from the fundamental theory, problem definition, reformulation into a convex

problem, analysis, algorithm implementation, to cutting edge researches (like an exploration journey rather than pure mathematics) in signal processing and communications. It has been used for my 32-hour (over 2 weeks) invited short course entitled "Convex Optimization for Signal Processing and Communications" at many top ranked universities in Mainland China over the last 8 years, including Shandong University, Jinan (January 2010), Tsinghua University, Beijing (August 2010 and August 2012), Tianjin University, Tianjin (August 2011), Beijing Jiaotong University (BJTU July 2013, July 2015), Beijing (July 2013), University of Electronic Science and Technology of China, Chengdu (November 2013 and September 2014 and September 2015), and Xiamen University, Xiamen (December 2013), Sun-Yet-Sen University (SYSU), Guangzhou, (August 2015), Beijing University of Posts and Telecommunications, Beijing, (July 2016).

Grading:

TA: to be determined; Office hours: to be determined

(Office: EECS Building 706, Tel: X34033)

Homework: 15%;

Midterm Exam: 30%; (written examination in class)

Final Exam: 30%; (written examination in class)

Term Project: 25% (no more than 2 persons per group)

Remarks:

1. The language of instruction is English.
2. Homework must be handed in by the deadline by yourself. The score will be multiplied by a **factor of 0.7 per day passing the deadline.**
3. *Nonlinear adjustment* will be made as needed for the final term grade.
4. Course website: <http://www.ee.nthu.edu.tw/cychi/courses-e.html>
5. No make-up for mid-term and final examinations under any circumstance.
